

---

Drupal Site Manager Hosting System is a fully **€299.00**

managed high performance Drupal Platforms installer (you can interactively choose the platforms you wish to install on the hosting instance) and updater that you can run from your web browser. It allows installation of new versions of drupal platforms with clean directory structure, with code shared between all created instances, so one hosting instance is using only ~18 MB, while most of the code, which is over 1700 MB total, is shared. Sharing the code between instances is of critical importance, because it allows you to dramatically lower RAM and CPU usage, because most of the actively used code is opcode cached.

Each server allows you to set up as many hosting instances as you like (one for testing, one for development and one or more for production, for example), and each provides automatic drupal site creation, backup, restore, cloning, migration, cron runs, cache clears, registry rebuilds and more. It is a complete solution for creating and managing drupal sites that is fine-tuned for performance with many different levels of caching. You can resell your services on this platform, or you can use it for your own needs. You can create custom installation profiles or use any of the included install profiles.

=== Included by default -

- \* All libraries & tools required to install and run Nginx based system.
- \* Latest release of MariaDB 10.x Galera or Percona database server with manager.
- \* Latest version of Nginx web server.
